1 Scope and Application

This EUROMAP recommendation defines the connection between the injection moulding machine (IMM) and the external safety device, e.g. doors in fences around IMM, preventing access to the danger areas of the IMM with the possibility to reach into the area with high safety level specified in EN 201 "Plastics and rubber machines – Injection moulding machines – Safety requirements". This is intended to provide interchangeability. The interface is only used for the IMM, if other safety signals are necessary for other equipment, this falls under the responsibility of the user / integrator.

In addition, recommendations are given for signal voltage and current levels.

2 Description

The signals in both the injection moulding machine and the external safety device are given by contacts, e.g. contacts of relays or switches, semiconductors, etc. The contact making is either potential-free or related to a reference potential supplied to a contact of the plug mounted on the injection moulding machine (see Table 1). All signals which are not optional shall be supported by the injection moulding machine and external safety device.

2.1 Plug and socket outlets

The connection between the injection moulding machine and the external safety device is achieved by the plugs specified below. For the injection moulding machine (see Figure 2) and the external safety device (see Figure 1) the plug contacts should be capable of taking a minimum of 250 V and 10 A.

Arrangements of pins and sockets viewed from the mating side (opposite the wiring side)

![Socket and Pin Diagram]

Figure 1: Plug on the external safety device  Figure 2: Plug on the injection moulding machine
2.2 Contact specification

2.2.1 Emergency stop, safety device
- The voltages of the signals must not exceed 50V DC or 250V AC.
- A current of at least 6 mA must be maintained during signalling.
- The maximum current is 6A.

2.2.2 Logical Signals
- These signals shall be in accordance with clause 3.3.1 of EN 61131-2, Table 9, Type 2 or with clause 3.3.3 of EN 61131-2, Table 11, max. 0,1 A unless otherwise specified.

2.2.3 Reference potential
- Voltage 18 – 36V DC
- Overlayed ripple max. 2,5Vpp
- Withstand against overvoltage up to 60V min. 10 ms
- Current max. 2A

2.3 Plug contact assignment

Notes on the tables below:
- All signals are continuous signals unless otherwise noted.
- The signals are conducted from the signal source to the respective pin.
