1 Scope and Application

This EUROMAP recommendation defines the connection between plastics and rubber machines for the exchange of safety signals. This is intended to provide interchangeability.

This recommendation describes an interface used for safety signals only. This can be used, when non-safety relevant signals are exchanged via other interfaces (e.g. on the basis of OPC UA).

This part of the recommendation is used, when only one safety device is present or one signal for multiple safety guards is sufficient. If two safety devices are regarded separately (e.g. safety devices for front and rear side of machine), part 2 shall be used.

2 Description

The interface connects two machines A and B with the following requirements:

- Both machines are equipped with emergency stop devices.
- Actuation of the emergency stop device of one machine causes also emergency stop of the other.
- Machine A is equipped with one safety device (e.g. safety guard, footboard safety, etc.) that allows dangerous movements of machine B.

Example: machine A: injection moulding machine, machine B: robot

2.1 Plug and socket outlets

The connection between the machines is achieved by the plugs specified below.

Arrangements of pins and sockets viewed from the mating side (opposite the wiring side)

Figure 1: Plug on machine A

Figure 2: Plug on machine B

2.2 Contact specification

- The voltages of the signals must not exceed 50 V DC.
- A current of at least 6 mA must be maintained during signalling.
- The maximum current is 2 A.

2.3 Performance levels of signals

- The signals from the safety devices shall be in accordance with $PL_r = d$ (EN ISO 13849-1) or higher.
- The signals from the emergency stops shall be in accordance with $PL_r = d$ (EN ISO 13849-1) or higher.

A higher Performance Level might be required due to a risk assessment (e.g. by the integrator)

2.4 Signal delay

Safety signals transmitted via two channels shall have a maximum delay $<0,5$ s between channel 1 signal and channel 2 signal. This is to be applied to "Emergency stop of machine" and "Safety devices of machine".

2.5 Plug contact assignment

**Table 1: Plug on machine A
Signals from machine A to machine B**

Contact No. see fig. 1	Signal designation	Description
A1/A5	Emergency stop of machine A channel 1	The switch contact shall be open when emergency stop device of machine A is being actuated. Opening the switch contact causes emergency stop of machine B.
A2/A6	Safety device of machine A channel 1	The switch contact is closed when the safety device (e.g. safety guard, footboard safety, etc.) on machine A is operative so that dangerous movements of machine B are possible. The signal is active in any operation mode.
A3/A7	Emergency stop of machine A channel 2	The switch contact shall be open when emergency stop device of machine A is being actuated. Opening the switch contact causes emergency stop of machine B.
A4/A8	Safety device of machine A channel 2	The switch contact is closed when the safety device (e.g. safety guard, footboard safety, etc.) on machine A is operative so that dangerous movements of machine B are possible. The signal is active in any operation mode.

**Table 2: Plug on machine A
Signals from machine B to machine A**

Contact No. see fig. 1	Signal designation	Description
B1/B5	Emergency stop of machine B channel 1	The switch contact shall be open when the emergency stop device of machine B is being actuated. The switch contact opening causes emergency stop of machine A. The switch contact shall be operative if machine B is switched off. It is recommended that the switch contact is operative when machine B is unselected.
B3/B7	Emergency stop of machine B channel 2	The switch contact shall be open when the emergency stop device of machine B is being actuated. The switch contact opening causes emergency stop of machine A. The switch contact shall be operative if machine B is switched off. It is recommended that the switch contact is operative when machine B is unselected.
B2/B6	Machine B unmounted	The contact shall be closed when machine B is unmounted and a blind plug is used on machine A. In this case, the emergency stop signals B1/B5 and B3/B7 have to be bridged in the blind plug. The schematic drawing of the blind plug is shown in Figure 4. The contact shall be open when machine B is connected.
B4/B8	Spare	Reserved for future use by EUROMAP

3 Schematic drawing of the interface

Figure 3 shows the schematic drawing of the interface with the emergency stop device not actuated and the safety device not operative.

Figure 3: Schematic drawing of the interface

Figure 4: Schematic drawing of the blind plug

4 Sources of supply

A list of suppliers for the plugs described in clause 2 can be downloaded from the following website:
